

Tissue Imaging with New MALDI-TOF(TOF) Instrumentation

Presented at MSIA 2013

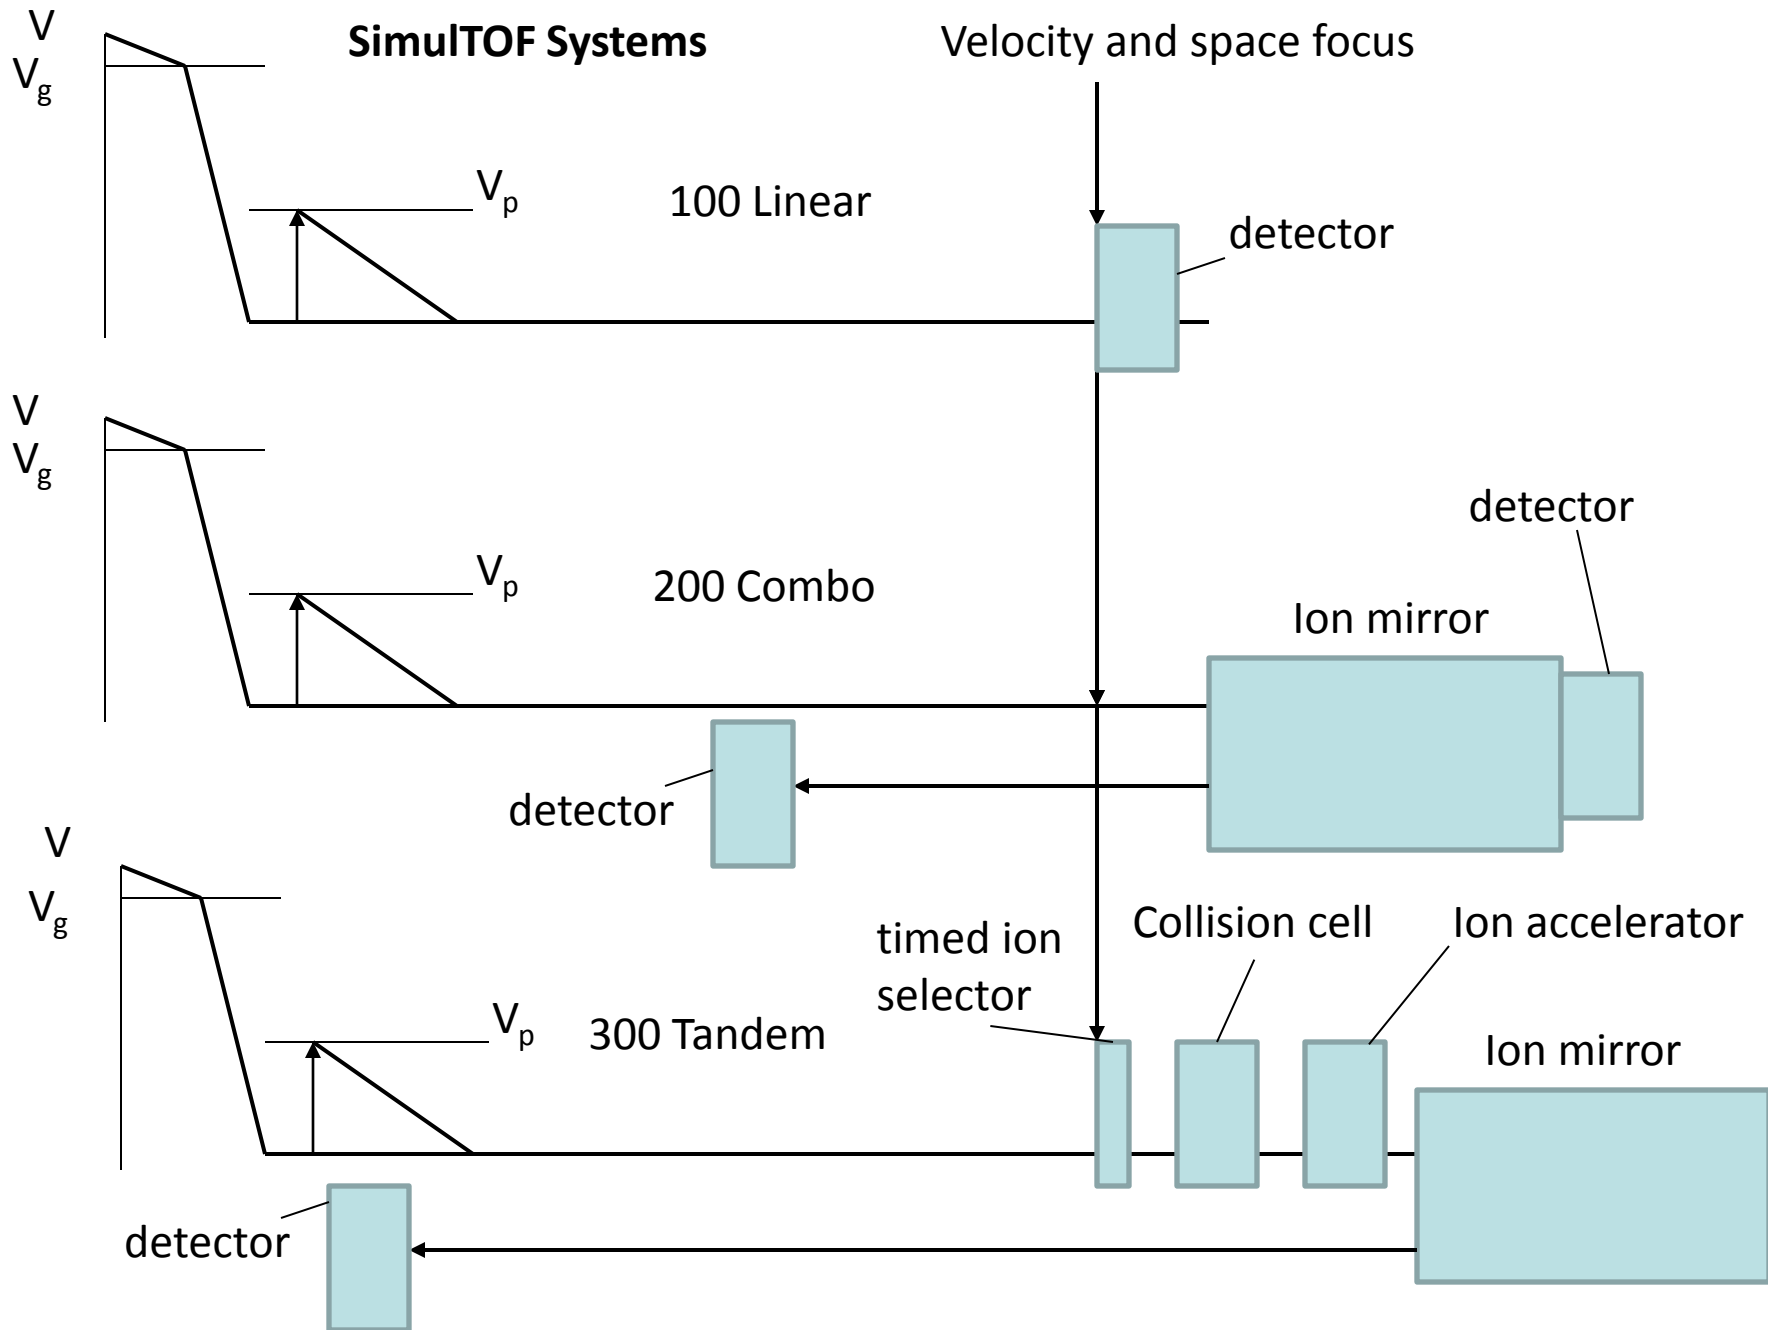

Vanderbilt University

April 17,2013

Marvin Vestal, CSO

Outline

- Design Philosophy
- Modular Approach
- Technical Advances
 - 5 kHz laser
 - Efficient Ions Optics
 - Improved time focusing
 - Fast and efficient high mass detector
 - High resolution precursor selection and multiplexing for TOF-TOF
- Summary of performance
- Application to tissue imaging

Commercial products introduced at ASMS 2012

Design Philosophy

- We have employed a modular design philosophy, where a number of systems/modules are common to all three initial products.
 - Reduces complexity
 - Delivers advantages for manufacturing and supply chain.
 - Facilitates our simultaneous introduction of multiple products
 - Enables options that respond to the needs of specific customers and applications.
- Deliver a robust/reliable product that consistently performs as intended.
- Design for manufacturability and serviceability
- Build on decades of experience designing, building, and maintaining instruments, particularly mass spectrometers
- Keep the manufacturing process as simple and straightforward as possible
- Ensuring adequate access for testing, troubleshooting, and repair.

Technical Advances in SimulTOF 100 Linear MALDI-TOF

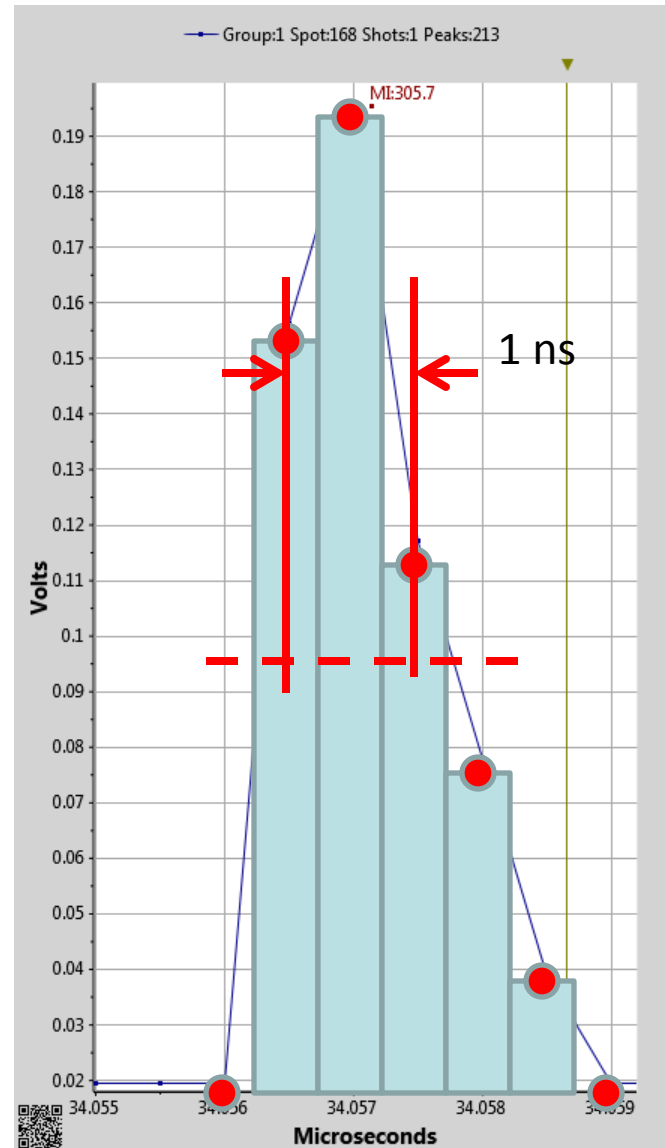

- 20 kV source and novel high speed, high mass detector provides very high sensitivity, resolving power, and accuracy over broad mass range
- isotopic resolution below 3 kDa, and isotopic envelope resolution for high masses to 50 kDa
- High laser rate (5 kHz) and high acquisition rate (up to 50 spectra/s) makes tissue imaging practical
- Proprietary ion optics and high laser rate provide sensitivity and dynamic range limited only by chemical noise
- Resolving power >4000 @2465 Da
- Resolving power >2m for full range from 100 to 2000 Da
- Mass range 100Da-500 kDa
- Mass error <30 ppm across the plate over the mass range 300-30,000 Da with single peak automatic calibration
- Dynamic range up to 100,000

Photonis detector

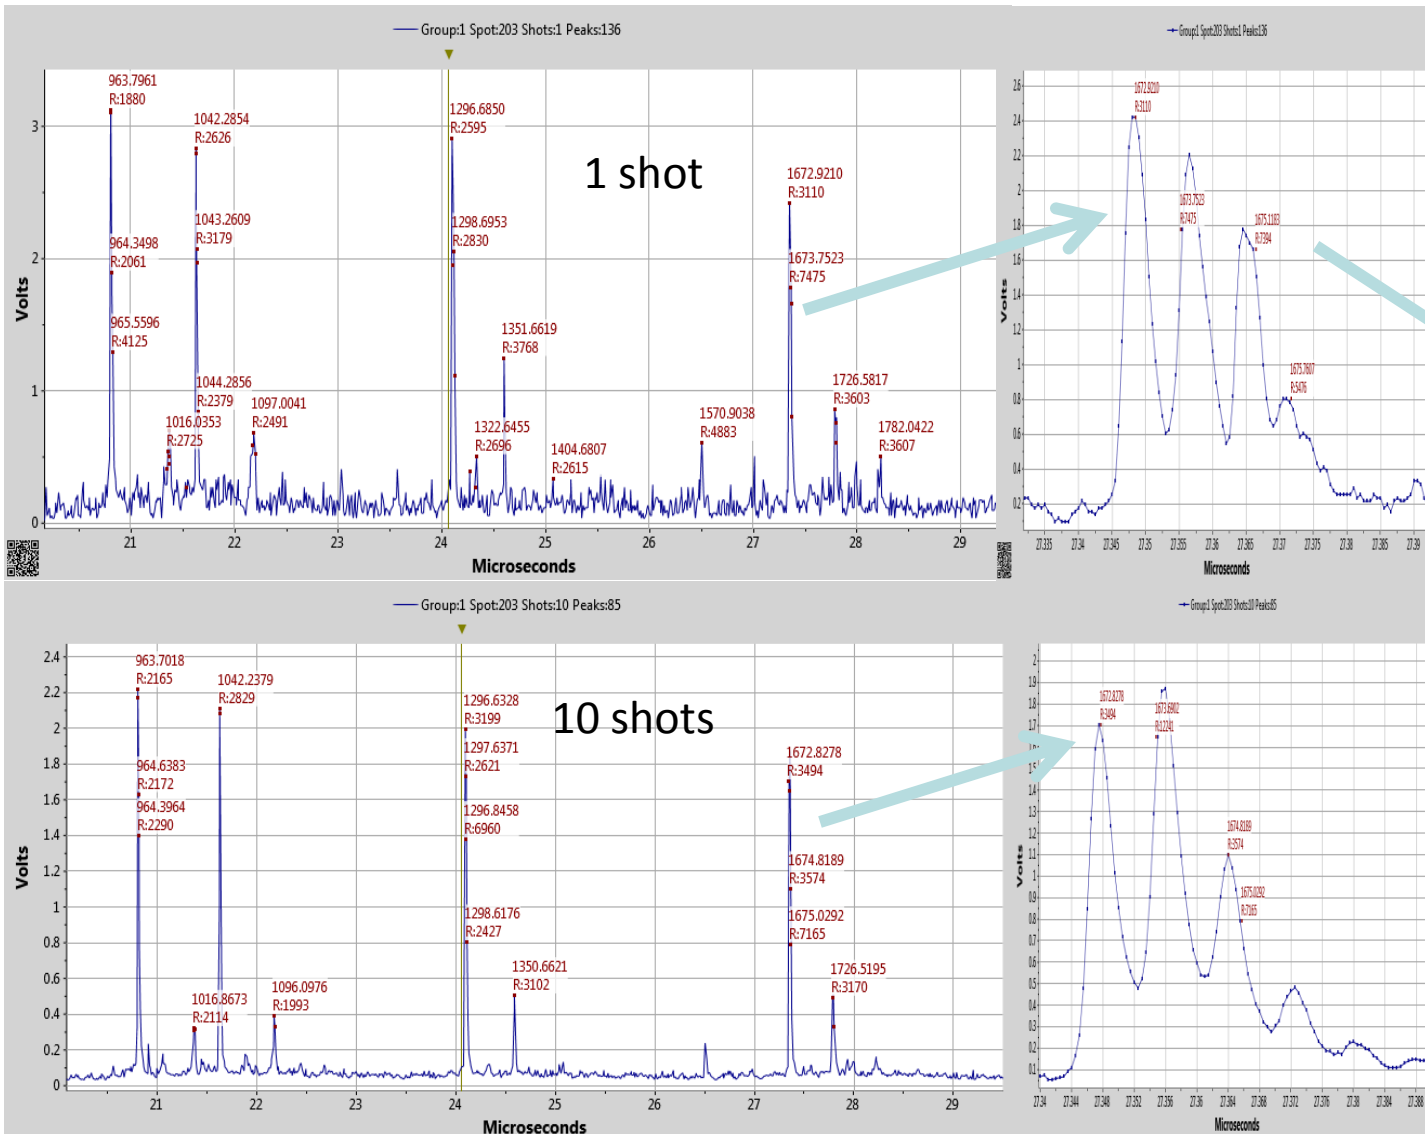

Potential diagram for linear detector

Typical single ion pulse with fast scintillator

Spectrum of α -cyano matrix dimer measured in SimulTOF 100 Linear MALDI-TOF At 15 kV energy using Photonis fast hybrid detector

~20,000 ions
detected
<240,000
Molecules
consumed

Mixture of peptide standards, 100 femtomole/ μL , 2.5 mm spot
Laser spot ca. 50 μm , fluence 1.3x threshold, 40 attomole/spot
<1% consumed/laser shot=240,000 molecules

Applications of MALDI-TOF

- Pathogen Identification
- Cancer typing directly from serum, tissue extracts, and other bodily fluids
- Tissue imaging
 - Proteins for cancer typing
 - Small molecules for drug disposition
- Biomarker Identification and Validation
 - Mass Spec Immunoassay
 - Peptide quantitation (SISCAPA and others)
- Clinical assays of biomarkers for diagnosis and treatment
- QC of synthetic oligonucleotides, peptides, proteins and small molecules

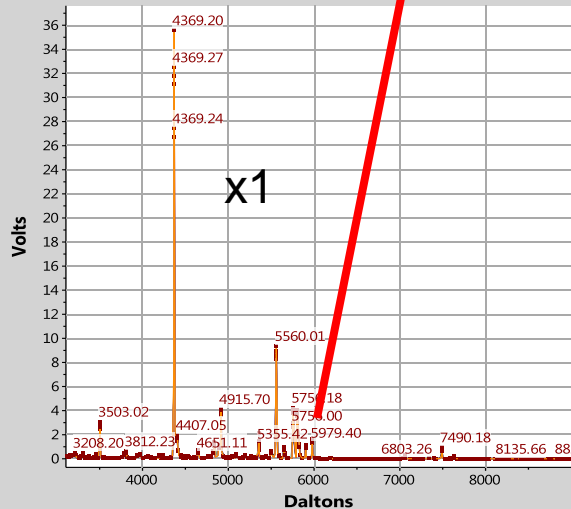

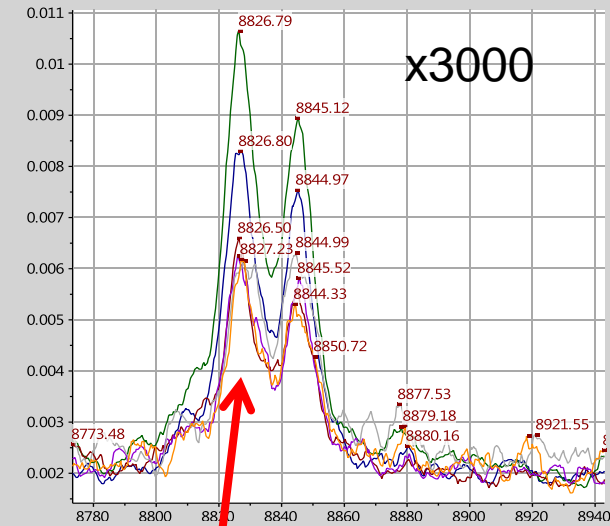

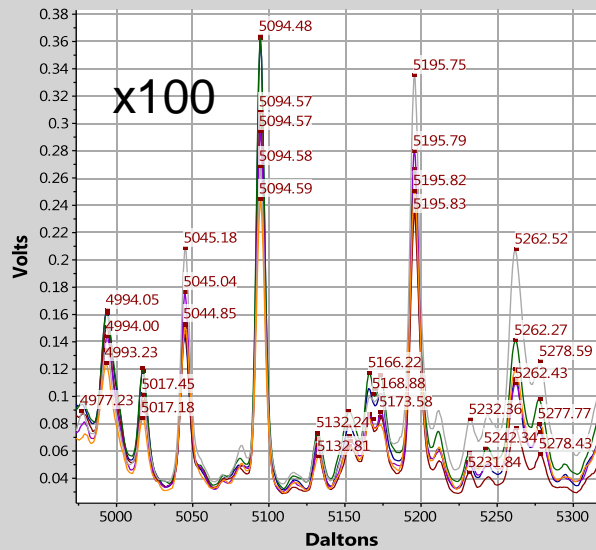

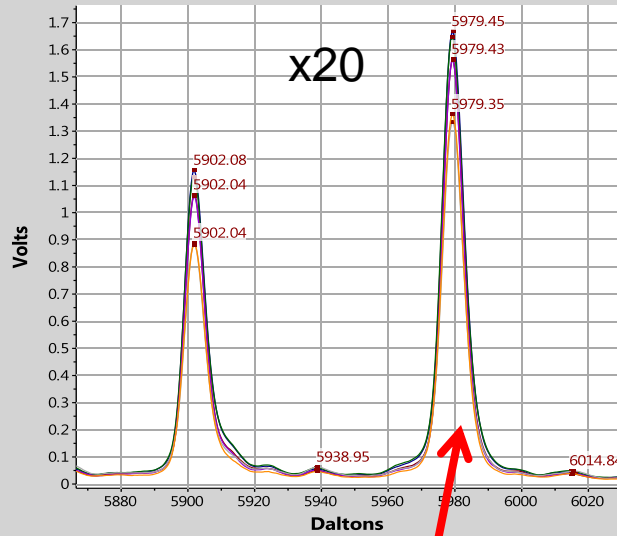

Performance of SimulTOF 100 Linear for Complex Biological Samples

- Human Saliva
 - Diluted 5:1 in HCCA matrix and spotted on MALDI plate
 - 17 spots analyzed in linear mode over mass range 3000-3000
 - 5000 shots summed to produce spectra
 - At 5 kHz acquisition time is 1 second
- Serum sample
 - diluted 1:10 in sinipinic acid
 - 10 spots analyzed in linear mode over mass range 3000-3000
 - 10000 shots summed to produce spectra
 - At 5 kHz acquisition time is 2 seconds
- Oligonucleotides

Spectrum from one spot (3 mm dia) for 1:5 dilution of saliva sample in HCCA
5000 shots

Examples of Superimposed Spectra from 6 spots across the plate illustrating dynamic range and mass accuracy obtained in saliva analysis

Sensitivity, Dynamic Range, and Reproducibility are Key Metrics

Data from SimulTOF 100 Linear

Sensitivity, Dynamic Range, and Reproducibility are Key Metrics

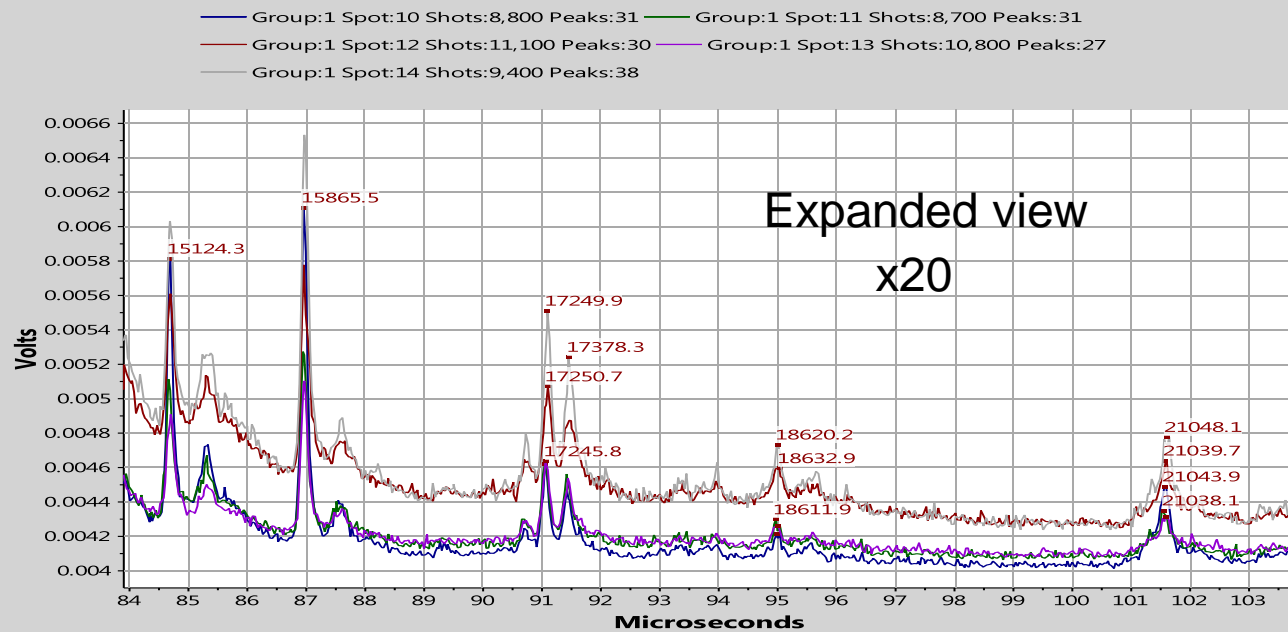

Data from SimulTOF 100 Linear

— Group:1 Spot:10 Shots:8,800 Peaks:31 — Group:1 Spot:11 Shots:8,700 Peaks:31
 — Group:1 Spot:12 Shots:11,100 Peaks:30 — Group:1 Spot:13 Shots:10,800 Peaks:27
 — Group:1 Spot:14 Shots:9,400 Peaks:38

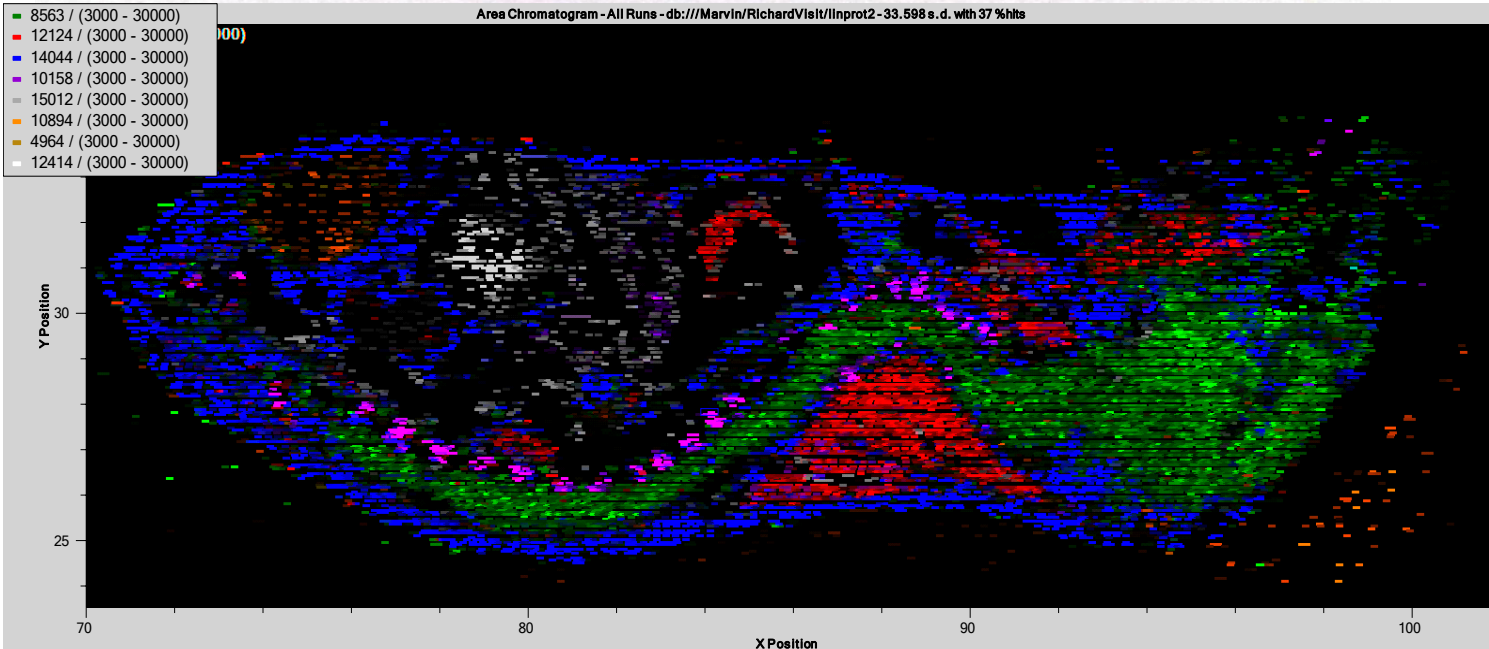

These are raw data. No normalization, background subtraction, smoothing or other data processing has been employed.

Conclusions

- Resolving power 500-1000 over wide range is routine
- Normalization to TIC removes most of amplitude variation
- Each spot will yield up to 100,000 shots without degrading resolving power or accuracy and giving dynamic range limited only by chemical noise
- Results might be improved by multiple levels of dilution and use of alternative matrices
- Mass error <30 ppm across the plate over the full mass range with single peak automatic calibration
- Dynamic range up to 100,000

Specifications for SimulTOF 200 Combo MALDI-TOF

- Linear Analyzer (identical to 100)
 - 20 kV source and novel high speed, high mass detector provides very high sensitivity, resolving power, and accuracy over broad mass range
 - isotopic resolution below 3 kDa, and isotopic envelope resolution for high masses to 50 kDa
 - High laser rate (5 kHz) and high acquisition rate (up to 50 spectra/s) makes tissue imaging practical
 - Resolving power >5000 @2465 Da
 - Resolving power >2m for full range from 100 to 2500 Da
 - Mass range 100Da-500 kDa
- Reflecting Analyzer
 - Resolving power >20,000 at focus mass, >10,000 over range 800-3000 Da
 - Detection limits for peptides and small molecules <10 attomole/mL
 - Mass error <5 ppm RMS with automatic internal calibration

Peptide standards 1fM/ μ L CHCA 3000 shots from single spot
 Calibration peak at 1042.285 is offscale

Resolving power >20,000 at focus mass
>10,000 over range 800-3000 Da

Peptide standards 100 fM/μL CHCA 500 shots

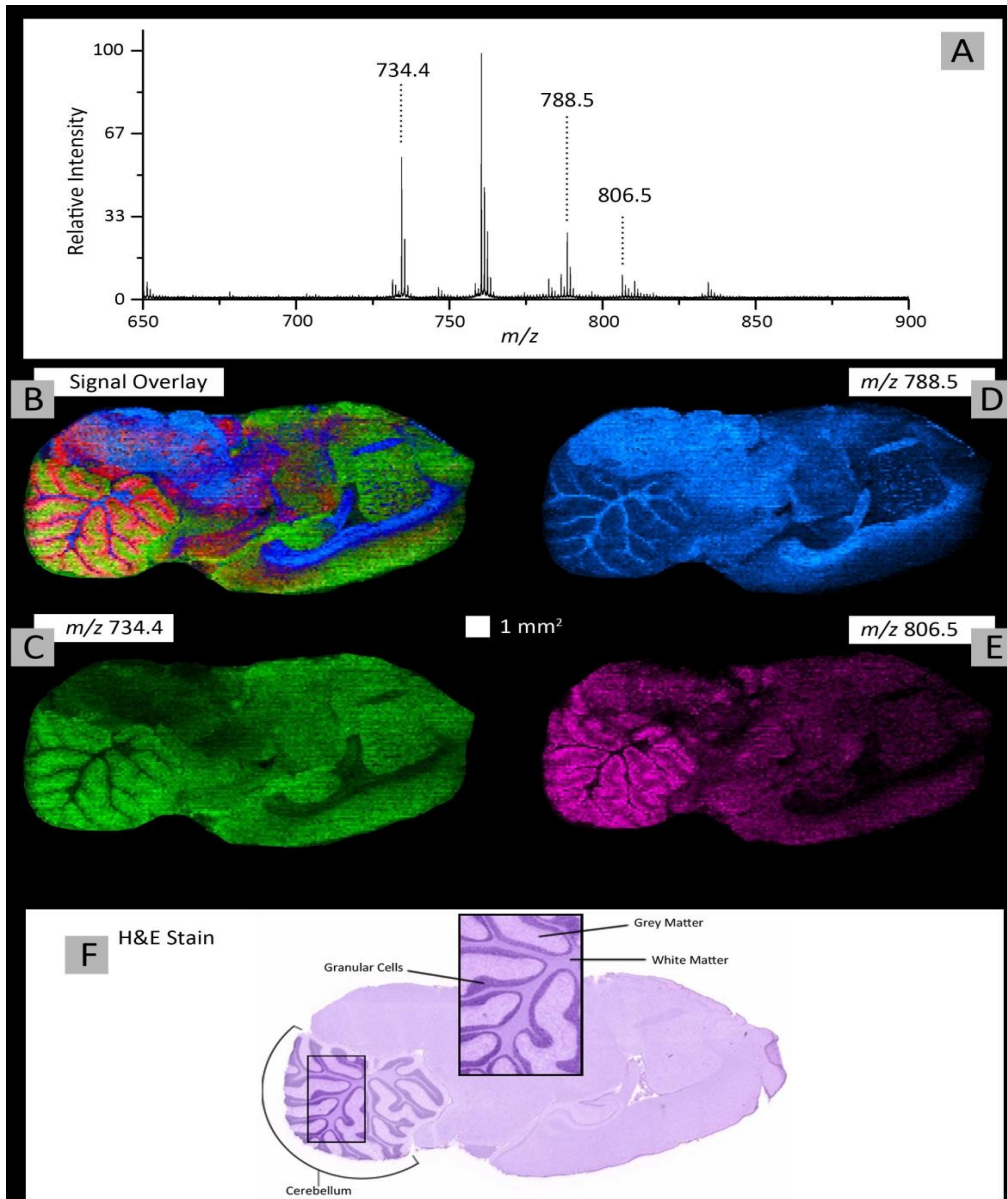

Peptide standards 100 fM/ μ L CHCA 500 shots, higher intensity

Figure 1: A 100 μm spatial resolution lipid ion image of a sagittal rat brain tissue section using typewriter continuous laser raster sampling acquired in 10 minutes.

A representative spectrum is shown in A. The ion image overlay (B) of signal from m/z 734.4 (C), m/z 788.5 (D) and m/z 806.5 (E) highlights the differentiation of the spatial distributions for the selected ions. These results correlate to the H&E stained serial tissue section highlighting structural difference between grey matter, white matter and granular cells in the cerebellum (F). Important instrumental parameters:

**3 kHz laser repetition rate,
5 mm/s sample stage velocity,
and 60 laser shots/spectrum
hardware average.**

Specifications for SimulTOF 300 MS-MS

- High laser rate (5 kHz), multiplexed MS-MS (10x,) and high acquisition rate (up to 50 spectra/s) makes tissue imaging and high throughput LC-MS-MS practical
- Proprietary ion optics and high laser rate provide sensitivity and dynamic range limited only by chemical noise
- High resolution precursor selection (>1000)
- Provides both PSD and CID fragment spectra with high sensitivity, high resolving power, and excellent mass accuracy
- Performance substantially exceeds that of all existing MALDI MS-MS instruments
- Efficient structure determination for molecules detected by MALDI-MS
